Main features

Type of database

Type of database Study databases

Study databases (details) Case control study

Database recruitment is carried out by an intermediary A selection of health institutions and services

Database recruitment is carried out as part of an interventional study No

Additional information regarding sample selection. Selection and recruitment of subjects having the required inclusion criteria by the participating physicians

Database objective

Main objective

Main:

- Evaluate the differences between the cases afflicted with primary open-angle glaucoma (POAG) and the controls afflicted with isolated ocular hypertension (OHT) concerning the potential risk factors, including sociodemographic factors, systemic diseases and treatments in progress, family antecedents of glaucoma, the duration of the disease, the factors linked to the eye, nutritional factors and the exposure to environmental neurotoxic compounds.

Secondary:

- Derive a predictive function by using the significant risk factors, in such a way as to assist

ophthalmologists in classifying patients having a hypertonia with a high risk of developing glaucoma

Inclusion criteria

For the cases:

- Male or female aged 40 years or older;
- Patients with a diagnosed POAG, confirmed by a structural and function degradation;
- Patients for whom a IOP > 21 mm Hg was recorded at one time in the evolution of the disease.

For the controls

- Male or female paired with the age of the case (\pm 2 years);
- Patients having an IOP > 21 mm Hg on the day of the examination and/or a hypotonisant treatment;
- Patients with a visual acuity with optimal correction higher than 5/10;
- Patients with no anomaly in the visual field characteristic of glaucoma.

Population type

Age

Adulthood (25 to 44 years)
Adulthood (45 to 64 years)
Elderly (65 to 79 years)
Great age (80 years and more)

Population covered

Sick population

Gender

Male
Woman
