Database objective

Main objective

The epidemic of coronavirus induces a major influx of patients implying a rapid modification of the organizations, a work overload and a significant stress for the care teams and supports of the hospitals of the Assistance Publique - Hôpitaux de Paris (AP-HP) . To this is added the impact on each professional of the large number of very severe patients to be treated, of death and the anxiety of contamination, reinforced by the actual cases of staff themselves sick. Emergency phone numbers for professionals in the event of psychological suffering were quickly put in place at the AP-HP and Hospitals level. The objective of this study is to assess the psychopathological and psycho-traumatic consequences of this exceptional situation on the staff, during the epidemic and at a distance from it, in order to be able to target the solutions to be implemented. Hypothesis is that some personnel may develop one or more of the following disorders: adjustment disorder or other anxiety disorder, acute stress disorder, post-traumatic stress disorder (PTSD), and depressive episodes as defined in the DSM-5. This study also aims to assess effect of support measures put in place, by comparing the evolution of those who benefited from those who did not use them, as well as the risk factors specific. The results will make it possible to have an estimate of the percentage of people who may require specific support, and to identify the staff most at risk, and thus predict the importance of the circuits and structures for support of staff which will be necessary in the short and long term. The main anticipated risk factors are: being a nurse, having a low number of years of professional experience, and being on the front line of care for affected patients.

Inclusion criteria

Inclusion Criteria:

AP-HP professionals on duty during the COVID epidemic agreeing to participate in the three stages of the study.

Exclusion Criteria:

none

Population type

Age

Adulthood (19 to 24 years)
Adulthood (25 to 44 years)
Adulthood (45 to 64 years)

Elderly (65 to 79 years)

Population covered General population

Pathology

Gender Male
Woman

Geography area National

Detail of the geography area Establishment of Assistance Publique - Hôpitaux de Paris

Data collection

Dates

Date of first collection (YYYY or MM/YYYY) 12/06/2020

Date of last collection (YYYY or MM/YYYY) 31/12/2021

Size of the database

Size of the database (number of individuals) [1000-10 000[individuals

Data

Database activity Data collection completed

Type of data collected Clinical data
Declarative data
Paraclinical data

Declarative data (detail) Internet self-questionnaire

Presence of a biobank No

Procedures

Data collection method Limesurvey Online

Quality procedure(s) used Designed by CLinical Research Datamanager of Reserch Unit Henri Mondor Hospital , hosted on APHP server

Participant monitoring No

Followed pathology

Links to administrative sources No

Promotion and access

Promotion

Access

Presence of document that lists variables and coding procedures Yes
